Five progress notes as required:

1. We prepared a cleaned working copy of both Online Retail II sheets while preserving the raw source rows.
2. EDA checks the cleaned data for size, missing values, duplicates, dates, value ranges, and country counts.
3. The notebook then saves the unchanged source rows to the Bronze Delta table.
4. It writes cleaned sales, cancellations, exceptions, and a quality log to Silver tables in Databricks.
5. Next: run the notebook on a small sample, review the outputs, then run full data once and plan checkpoint 4.
